Credit: Canon By Michael Garrett Canon printers must be cleaned and maintained, like any other printer, to maintain optimal print quality. Inkjet printers use print heads, which occasionally plug in ink, causing a loss of quality. Fortunately, the process is very simple to run, whether you are using a Windows-based PC or a Mac OS X-based computer. If you're experiencing a decline in the print quality of your Canon printer, follow these simple steps to make your prints look stunning. Start by ensuring that both your computer and your printer are turned on and working properly. Cleaning print heads uses a small amount of your available ink, so also make sure you have enough ink on all your cartridges (Canon printers have LEDs with an ink drop icon that will flash when the ink volume is low). Click the Start menu in the lower-left corner of your screen. Click the Printers icon (it can also say Printers & Faxes). If you don't see this icon, you can select Control Panel, and then select the Printers icon in the window that opens. Right-click the Canon printer and select after opening a window, displaying all your installed printers. Click the Maintenance tab at the top of the window. Turn on Clean Head, which will clean print heads. Click Start to start the process of cleaning your printer. Turn on both your Mac and the Canon printer Go to the Apps folder on Macintosh HD and double-click the Canon Printer Utility (BJ) icon. Select your printer from the list of printers, and then OK. Click the Clean Head button in the Utility dialog box. Follow the instructions to start the cleaning process. Click the confirmation button when the cleaning process is complete. Your printer utility can print a test sheet to check and see if the print heads are now clean. From c.d. Crowder If you have multiple computers in your home or network, create the Canon printer as a network printer. All computers on the network can then print to a printer. Depending on the type of Canon printer, add the printer to both wireless and wired networks. Windows provides users with a step-by-step guide to adding network printers after they are installed, including Canon printers. Install any software provided with the Canon printer on any computer on your network. The software helps to manually connect your printer to the network if necessary, and installs the required drivers. Follow the instructions to install software. Turn on the Canon printer and connect it to your network. If the printer uses a wired or Ethernet connection, connect the Ethernet cable to an available port on your wired router. If you are using your computer as a router, connect the Ethernet cable to an available port on your computer. For wireless connections, do not connect the Canon printer to your computer unless the software tells you to do so. Use a supplied USB cable to connect it if necessary. Allow the software to complete the installation of the Canon printer. Go to Start on any computer on your network. Select Devices and Printers. Select Add a network, wireless, or Bluetooth printer. Select the Canon printer from the list of available printers. Select Install Driver if prompted. If Windows cannot find the appropriate driver, insert the Canon software disc. Windows uses the driver from the disk. Choose whether to set the printer as the default, and tap Done. Repeat steps 4 through 11 on all computers that need access to the Canon printer. Printer.
